Expected Life for Ripple Current and Ambient Stress

■ Calculation Formula

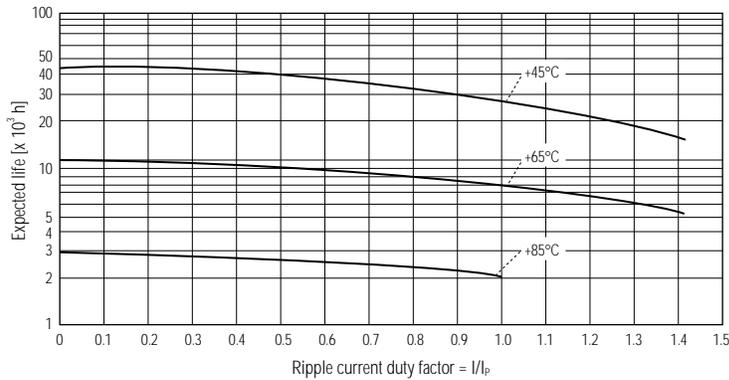

The life of aluminum electrolytic capacitors is highly affected by applied ripple current and ambient temperature. In general, the relation between life time, ripple current, and ambient temperature is known as:

Where:

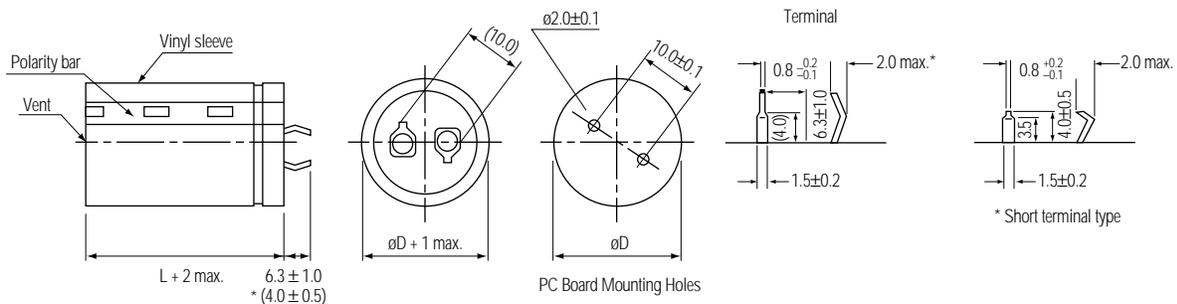

- I: Ripple current to be applied to the capacitor T°C (120 Hz... [A rms])
- I_p: Specified maximum permissible ripple current at 120 Hz, +85°C... [A rms]
- L: Expected life at T°C... [h]
- L₀: Specified life (series TS-U: 2,000 hours)... [h]
- T: Ambient temperature [°C]
- T₀: Hot spot temperature in the capacitor element = [maximum operating temperature] + [Δt at maximum ambient temperature] = [maximum temperature (series TS-U: +90-C)]... [°C]
- Δt: Temperature rise at constant current flow of maximum permissible ripple current value specified at +85°C (see graph1 Δt vs T)... [°C]

Conditions: $(I/I_p)^2 \leq 2$ times
